

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

When I cited ¹ the record in my list of the birds of Portland and vicinity, but one such Rail had been noted,² and that was shot in Scarborough. Now, however, there are two records ³ of King Rails from the very marsh on which Mr. Hanson found his birds. On the other hand, no Clapper Rails have been detected there or elsewhere in the vicinity of Portland since his identification was made. While the possibility that he was right remains, the probability that he was mistaken is so strong that I have felt obliged to call attention to it.

There is also to be considered a rail shot "about September, 1864" by Mr. Luther Redlon, and referred to in the original notice of Mr. Hanson's birds as "a probable" Clapper Rail, but not mentioned in my Portland list. If we adopt the hypothesis that the latter were King Rails, it can scarcely be doubted that the former was of the same species, and we are left without evidence that *Rallus crepitans* has occurred near Portland.—NATHAN CLIFFORD BROWN, *Portland, Me.*

A Wounded Sora's Long Swim.—While superintending the unloading of brick schooners at the Mt. Loretto dock, Pleasant Plains, Staten Island, N. Y., on September 20, 1906, I saw what I presumed to be a terrapin swimming along with the current of the ebbing tide. I sculled out in a small boat in order to investigate, and was surprised to find that the supposed turtle was a Sora Rail (*Porzana carolina*). As the boat drew near it beat the water frantically with its wings and made every effort to escape, but when finally captured, manifested a disposition to defend itself, and repeatedly struck my hands and fingers with its bill.

I confined the bird in a crate on one of the schooners, where a number of Sicilian laborers gathered around it, and signified their desire to make a meal of it. One of the laborers thrust a finger between the slats of the crate, and to my astonishment the rail rushed toward it with opened bill. In fact it showed little fear of human beings, pugnaciously resisting every intrusion, but when a small dog belonging on the vessel, approached and barked at it, the bird retreated in apparent terror to the opposite side of the crate.

A decided drooping of the Sora's right wing explained its disablement. It died within a few hours, and when I skinned it I found the muscles on the right side of the sternum badly bruised, and clothed with blood, as if the bird had flown forcibly against some hard object.

Judging from the direction from which the Sora had come, it must have swam all the way across Raritan Bay from the salt marshes near Jacksonville, New Jersey, a distance of at least nine miles.—ROBERT C. MURPHY, *Mt. Sinai, Long Island, N. Y.*
